Dear Customers:

Recently there have been reports of the rampant use of Roundup or Glyphosate on wheat. These reports have spawned a plethora of questions about the farming practices used for grains grown on land controlled by Wheat Montana Farms.

We are confident and able to report that we do not use Roundup on wheat, anytime during the growing season or prior to harvest as a burndown application.

First off, we do not have access to any Genetically Modified Wheat, that could stand the devastating effects of a Roundup application. While the corn and soybean industries do commonly grow varieties where this practice is common, it has not been approved for any commercial varieties of wheat in the U.S. or Canada.

Secondly, we do not apply Roundup as a way to kill the crop, and get the grain to ripen evenly. While this process is legal, it is not something that we need to do, nor is it something that we would do. Montana provides an arid climate whereby natural drying is more than adequate, and we just don't do it. Period.

We are committed to sustainable farming and using crop rotations, to improve the quality of our harvests, while improving the land that produces them. Ever since we have started using legumes in rotation, our grain crops have been better, and our organic matter has increased.

Please contact me personally, or anyone on our sales team, if you have any further questions or concerns.

Sincerely,

A handwritten signature in black ink that reads "De Folkvord". The signature is written in a cursive, flowing style.
